                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents an epitope from the wheat alpha-amylase. Antibodies which recognise the epitope are used in a two-site immunoassay for qualitative or quantitative detection of alpha-amylase in a test sample. The assay is used for detecting weather damage in a cereal grain. Weather damage is caused by the action of hydrolytic enzymes, e.g. amylases, in the grain endosperm. These enzymes accelerate the breakdown of starch granules and protein in the endosperm of germinating grain. Individual growers can identify areas of sprouting prior to harvest, preventing contamination of sound wheat by weather damaged wheat. The damaged grain can be harvested separately from the sound grain and financial losses resulting from down grading the whole crop can be avoided. The two-site immunoassays can be applied at mill or site of the start of grain or can be used on farms with minimal contamination.
                                                                                                                                                                                            Two site immunoassay for the qualitative or quantitative detection alpha-amylase in a test sample, used to detect weather damage in a cereal grain, such as wheat, rye, triticale or barley -
                                                                                                                                                                       Claim 1;

                                                                                                            The present sequence represents a wheat alpha-amylase. Antibodies which recognise epitopes from this protein are used in a two-site immunoassay for qualitative or quantitative detection of alpha-amylase in a test sample. The assay is used for detecting weather damage in a cereal grain. Weather damage is caused by the action of hydrolytic enzymes, e.g. amylases, in the grain endosperm. These enzymes accelerate the breakdown of starch granules and protein in the endosperm of germinating grain. Individual growers can identify areas of sprouting prior to harvest, preventing contamination of sound wheat by weather damaged wheat. The damaged grain can be harvested separately from the sound grain and financial losses resulting from down grading the whole or silo (elevator) receival of grain or can be used on farms with minimal contamination.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

                                                                                                                                The present sequence is that of alpha-amylase encoded by DNA clone alpha-Amy3-C (see AAI70540). Expression of alpha-Amy3-C increases to the use of an alpha-amylase gene promoter and signal sequence in the production of recombinant proteins in transgenic plants and transgenic plant seeds. In a claimed method, a transgenic monocot is obtained by transforming an immature embryo of the plant via Agrobacterium-mediated transforming an immature embryo of the plant via Agrobacterium-mediated transforming an immature embryo of the plant via Agrobacterium-mediated transformation with DNA comprising a plant alpha-amylase promoter (e.g. the rice alpha-Amy3-C promoter) that is induced under sugar-depleted or sugar-free conditions, a signal peptide sequence, and an exogenous sequence encoding a gene product; plant, which expresses the gene product under sugar-depleted or sugar-free conditions. The gene product may also be obtained by cultivating an angiosperm host cell. The transgenic monocot plants are especially useful in brewing and to produce glucose from starch.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              04-NOV-1992;

DNA encoding the signal peptide of alpha-amylase and the promoter along with the glucuronidase reporter gene and hygromycin resistance gene are used in the construction of a GUS gene expression vector, which when transformed into rice suspension-cultured cells, can be used to investigate the expression of the vector under the control of the promoter. The gene expression system can be used to conduct gene regulation and protein expression and secretion using the characteristics of the alpha-amylase gene promoter and the DNA sequence encoding the signal peptide. The present sequence represents an alpha-amylase related protein used in the course of the present inventing.

                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes isolated polynucleotides (PN) comprising a sequence selected from one of 835 nucleotide sequences given in AAA67073 to AAA67907, their (reverse) complements, sequences producing an Expectation (E) value of 0.01 or less compared to the 835 sequences, sequences at least 50% identical to them, 200, 100, 40 or 20-mers of the 835 sequences or sequences that are degenerately equivalent or allelic to the 835 sequences. The polynucleotides are used to modify the activity of a polypeptide involved in a polysaccharide biosynthetic pathway in the plant. They are especially used to modulate or alter the polysaccharide content, composition or structure of the plant. AAB16268 to AAB16340 are proteins encoded by some of the polynucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New genes encoding proteins involved in a plant polysaccharide biosynthetic pathway, useful for modulating or altering the polysaccharide content, composition or structure of the plant

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Agrobacterium-mediated transformation with DNA comprising a plant alpha-amylase promoter (e.g. the rice alpha-Amy7-C promoter) that is induced under sugar-depleted or sugar-free conditions, a signal peptide sequence, and an exogenous sequence encoding a gene product; regenerating the transformed plant; and growing the transgenic plant, which expresses the gene product under sugar-depleted or sugar-free conditions. The gene product may also be obtained by cultivating an angiosperm host cell. The transgenic monocot plants are especially useful in brewing and to produce glucose from starch.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of rice (Oryza sativa) cv. M202 alpha-amylase, encoded by isolated genomic DNA clone alpha-Amy7-C (see AA170537). Expression of alpha-Amy7-C in cultured suspension cells of rice was induced 6-fold at day 12 after sugar depletion, and continued to increase up to day 14. The invention relates to the use of an alpha-amylase gene promoter and signal sequence in the production of recombinant proteins in transgenic plants and transgenic plant seeds. In a claimed method, a transgenic monocot is obtained by: transforming an immature embryo of the plant via
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Producing a transgenic monocot plant comprising a transgene under control of an alpha amylase promoter and signal peptide sequences, provides transgenic plants particularly cereals for the brewing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI; 2001-647191/74.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI; 200
N-PSDB;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a gene expression system comprising the alpha-amylase gene promoter. DNA encoding the signal peptide of alpha-amylase and the promoter along with the glucuronidase reporter gene and hygromycin resistance gene are used in the construction of a GUS gene expression vector, which when transformed into rice suspension-cultured cells, can be used to investigate the expression of the vector under the control of the promoter. The gene expression system can be used to conduct gene regulation and protein expression and secretion using the characteristics of the alpha-amylase gene promoter and the DNA sequence encoding the signal peptide. The present sequence represents an alpha-amylase related protein used in the course of the present numerican

Other genes which may be inserted into the virus are those which control a phenotypic trait, such as male sterility, or sequences encoding anti-sense RNA which can be useful to prevent the expression of undesired phenotypic traits. The recombinant virus is derived from a plus sense, single stranded virus selected from tobamovirus, brome mosic virus, rice necrosis virus or a genthi virus.

The coding sequence was inserted into a recombinant plant viral nucleic acid which was then used to express a recombinant product (in this case rice alpha-amylase) in a plant. The plant viral sequence may be from tobacco mosaic, cucumber green mottle, cowpea mosaic, brome mosaic, broad bean mottle, rice necrosis, geminiviruses, tomato golden mosaic, Cassava latent and
                        A DNA sequence (AAT47095) codes for rice alpha-amylase (AAW10469). Movel viral nucleic acids can be constructed in which the alpha-amylase coding sequence is placed under control of the promoter of the tobacco mosaic virus coat protein gene, which has been deleted. The recombinant viral nucleic acid is capable of self-replication, encapsidation and systemic spread in infected tobacco plants, and directs expression of the alpha-amylase in plant
                                                                                                                                                                      Recombinant viral nucleic acid producing, e.g. male sterility in plants - comprises nucleic acid whose transcription is controlled

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
       protein. These heterologous sequences are preferably under the control of the native promoter sequence. By using a plant virus existing cells can be altered with a new coding sequences without involving germ cell. The recombinant viruses are stable and can cause systemic infection, with stable expression/transcription in plants that are hosts for the non-native part of the vector. The plants that are hosts for the non-native part of the vector.
                                                             The sequences given in AAW11868-71 represent proteins which were produced by the recombinant viruses of the invention. The viruses are recombinant plant viruses which comprise a native plant virus subgenomic promoter, at least one non-native plant virus subgenomic promoter, and a sequence encoding a plant virus coat protein. These heterologous sequences are preferably under the control of the native promoter sequence. By using a plant virus
                                                                                                                                                                                                                                                                                               Dawson

The invention relates to a recombinant plant viral nucleic acid derived from a plus sense, single stranded RNA plant virus. The recombinant plant viral nucleic acid comprises: (a) a first plant viral subgenemic promoter that is native to the plus sense, single stranded RNA plant virus and operably joined to a first nucleic acid expression sequence; and (b) a second plant viral subgenomic promoter that is non-native and is operably joined to a second nucleic acid expression sequence; where, (i) (a) and (b) are incapable of recombination with one another, (ii) either the
                                                                                                       Recombinant plant viral nucleic single stranded RNA plant virus products in a host
                                                                                                                                                                          Dawson

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  first or the second nucleic acid expression sequence is a plant viral coat protein coding sequence. The recombinant plant viral nucleic acid allows the transcription of products in a host, such as therapeutic and other useful polypeptides or proteins e.g. enzymes, complex blomolecules and ribozymes. It also gives the option of applying the coding sequence to the desired organism, tissue, organ or cell, is stable for the foreign coding sequences and is capable of systemic infection in the plant host. The transformation and regeneration of target organisms become
                                                                                                                                                                                                                                                               Dawson

The specification describes a recombinant plant viral nucleic acid derived from a positive (+)-sense RNA plant virus comprising a native (+)-sense RNA plant virus promoter that is linked to an expression sequence and a heterologous (+)-sense RNA plant virus promoter that is linked to an expression sequence. The promoters are incapable of recombination with each other, and one of the expression sequences encodes a plant viral coat protein while the other is optionally a heterologous coding sequence. The plant viral nucleic acid is capable of systemic infection in a host plant. The viral construct is useful for the introduction and expression of non-viral foreign genes in plants and the production of e.g. potential AIDS therapeutic drugs.
                                           Recombinant non-retroviral nucleic acid for producing proteins such interleukins, melanin and vaccines, comprises subgenomic promoters linked to sequences coding for viral coat protein and heterologous proteins
                                                                                                                                                  Donson

the callus to roots and sprouts in a regeneration medium. The met be used for mass production of a desired gene product in a plant cell. The present sequence represents the rice alpha-Amy7-C prote which is used in an example from the present invention.

The method

The present invention describes a gene expression system containing the promoter region of an alpha-amylase gene. Also described is a method for preparing a transgenic rice plant comprising: (1) infecting Agrobacterium into an unmatured embryo of a rice plant; (2) simultaneously culturing the embryo with a suspended culture of a dicotyledon during the transforming step; (3) growing the transformed embryo to a callus in a selective medium containing a plant growth hormone; and (4) regenerating

                     The present invention relates to the genome sequence of Listeria common copyrigenes EGD-e (see ABA03041). The genome sequence and fragments of the area useful for selecting probes and primers for detecting genes in L. CC monocytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present sequence is a protein cc expressed from the genome sequence are useful for raising specific antibodies, identification of L. monocytogenes and related organisms, and cc for biosynthesis and biodegradation, especially biosynthesis of Vitamin cc B12. The genome sequence and proteins encoded by it are also useful for selecting compounds that regulate gene expression and cell replication cc and modulate L. monocytogenes related diseases. In addition, the genome sequence and proteins encoded by it are useful in pharmaceutical and cc vaccines compositions for the treatment or prevention of infections by L. CC monocytogenes and related organisms.

CC Note: The sequence data for this patent did not form part of the printed composition, but was obtained in electronic format directly from WIPO cc at fig. wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Best Local Similarity 70.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Buchrieser C, Frangeul L, Couve E, Nustry, Kunst F, Cussurget O, Chetouani F, Nedjari H, Glaser P, Kunst F, Cussurget O, Chetouani F, Nedjari H, Glaser P, Vazquez-Boland JA; Domiels J, Goebel W, Kreft J, Kuhn M, Ng E, Vazquez-Boland JA; Domininguez-Bernal G, Garrido-Garcia P, Tierrez-Martinez A, Amend A; Chakraborty T, Domann E, Hain T, Berche P, Charbit A, Durant L; Perez-Diaz J, Baquero F, Garcia Del Portillo F, Gomez-Lopez N; Perez-Diaz J, Baquero F, Garcia Del Portillo F, Gomez-Lopez N; Pavannio E, De Pablos B, Wehland J, Kaerst U, Entian K, Hauf J;
                                                                                                                                 B12. The genome sequence and proteins encoded by it are also useful for selecting compounds that regulate gene expression and cell replication and modulate L. monocytogenes-related diseases. In addition, the genome sequence and proteins encoded by it are useful in pharmaceutical and vaccines compositions for the treatment or prevention of infections by monocytogenes and related organisms.

Note: The sequence data for this patent did not form part of the printe
                                                                                                                                                                                                                                                 monocytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present sequence is a protein encoded by the genome sequence of the present invention. Proteins expressed from the genome sequence are useful for raising specific antibodies, identification of L. monocytogenes and related organisms, for biosynthesis and biodegradation, especially biosynthesis of Vitam.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WO200177335-A2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated polypeptide that comprises a CC sequence with 60 % sequences (S1), given in specification, or a sequence CC polypeptide (PSP) sequences (S1), given in specification, or a sequence CC encoded by a nucleic acid comprising one of 114 prostate specific nucleic coid (PSNA) sequences (S2), given in specification. Also included are CC acid (PSNA) sequences (S2), given in specification. Also included are CC are proposed to the PSNA, a host cell comprising the vector. CC preparation of the PSP, a polypeptide encoded by the PSNA; an anti-PSP CC antibody the antibody or its fragment, a kit for detecting a risk of CC cancer or presence of cancer in a patient, comprising unit for CC cancer or presence of the PSP or the PSNA in a sample of a patient CC determining the presence of the PSP or the PSNA. The PSNA is useful for CC determining the presence of a prostate specific nucleic acid (PSNA) in a CC determining the presence of the PSP or the PSNA. The PSNA is useful for CC treating a patient with prostate specific nucleic acid (PSNA) in a prostate specific protein in a sample. The antibody is also useful for CC treating a patient with prostate cancer, where the administration of the cantibody induces an immune response against the prostate cancer cell antibody induces an immune response against the prostate cancer cell performs the psecond column of the PSNA in a cancer cell antibody induces an immune response against the prostate cancer cell performs the psecond column of the PSNA in a cancer cell antibody induces an immune response against the prostate cancer cell performs and column of the PSNA in a cancer cell antibody induces an immune response against the prostate cancer cell performs and column of the PSNA in a cancer cell antibody induces an immune response against the prostate cancer cell antibody induces an immune response against the prostate cancer cell performs and column of the PSNA in a cancer cell in the prostate cancer where the administration of the psNA in a cancer cel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                expressing the nucleic acid molecule or polypeptide. The PSP or the PSNA is useful for diagnosing and monitoring the presence and metastases of prostate cancer in a patient. The PSP is useful as a vaccine component for eliciting a humoral and/or cellular immune response, and for identifying an agonist and antagonist. The PSNA is used in gene therapy, identifying an agonist and antagonist. The PSNA is used in gene therapy,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI;
                                                                                                                                                                                                                                                                                         producing transgenic animals and cells, and for producing engineered prostate tissue for treatment and research. The PSNA is useful for detecting prostate cancer by detecting genetic lesions or mutations. PSP and the PSNA are useful for detecting, diagnosing, monitoring, staging and predicting cancers. The PSP and the PSNA are also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ABG66859 standard; Protein; 54
diagnosing, monitoring, staging, imaging and treating prostate cancer and non-cancerous disease states in prostate tissue. The present sequence is a prostate specific protein (PSP) sequence.
                                                                                                                                            identifying prostate tissue, and thus is useful in forensic science, prostate cell differentiation and development and in tissue engineering. The PSP, the PSNA and the antibody are useful for identifying,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 11; Page 225-226; 248pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sox
Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic CC polypeptides. The proteins and their associated DNA sequences are used in CC the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypercosis and osteomyelitis), uveitis and endophthalmitis. CC P. acnes is also involved in infections of bone, joints and the central CC nervous system, however it is particularly involved in the inflammatory CC lesions associated with acne vulgaris. A method for detecting the gresence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention CC and determining the amount of bound protein in the sample. The polypeptides may be used as antipens in the production of antibodies compression and activity of P. acnes polypeptides and ctermining P. acnes proteins. These antibodies can be used as CC diagnostic agents for determining P. acnes presence, for example, by CC Note: The sequence data for this patient did not form part of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed content of the printed cont

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SQX
The invention relates to constructing (M1) a strain of diploid fungal CC cells in which both alleles of a gene are modified, comprising modifying CC one allele by insertion or replacement; by a cassette having an expressible selectable marker and modifying other allele by CC recombination, of a promoter replacement fragment with a heterologous CC promoter, so that expression of the second allele is regulated by the CC promoter. (M1) is useful for constructing a strain of diploid fungal CC cells in which both alleles modified are useful for identifying a gene that contributes to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent, an antifungal agent that inhibits the growth of a diploid fungus and for identifying a threapeutic agent for treatment of a mammalian candisease. (M1) is useful for identifying a compound which modulates the activity of a gene product, preferably enzymatic activity, carbon compound catabolism, biosynthetic, transporter, transcriptional, compound catabolism, biosynthetic, transporter, transcriptional, signal transduction, DNA replication and cell division activity to inhibit growth or proliferation of C. ability to inhibit growth or proliferation of C. ability to inhibit growth or proliferation of C. ability and infection by C. albicans. The present sequence is that of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

(I) have cytostatic CC activity, and can be used in gene therapy and vaccine production. (I) CC proteins and polynucleotides may be used in the prevention, diagnosis and CC treatment of diseases associated with inappropriate (I) expression. For CC example, they may be used to treat disorders associated with decreased CC expression by rectifying mutations or deletions in a patient's genome CC that affect the activity of (I) by expressing inactive proteins or to CC polynucleotides may be used to produce the scretted (I), by inserting CC the nucleit acids into a host cell and culturing the cell to express the CC protein. (I) proteins and polynucleotides may be used to prevent, and polynucleotides may be used to prevent, CC diagnose and treat immune/haematopoietic related diseases, especially CC concers and cancer metastases of haematopoietic antigen genomic concers and cancer metastases of haematopoietic antigen genomic concers and cancer metastases of haematopoietic antigen genomic concers and cancer metastases of haematopoietic antigen genomic concers and cancer metastases of haematopoietic antigen genomic concers and cancer metastases of haematopoietic antigen genomic concers and cancer metastases of haematopoietic antigen genomic concers and cancer metastases of haematopoietic antigen genomic concers and cancer metastases of haematopoietic antigen genomic concers and cancer metastases of haematopoietic antigen genomic concers and cancer metastases of haematopoietic antigen genomic concers and cancer metastases of haematopoietic antigen genomic concers and cancer metastases of haematopoietic antigen genomic concers and cancer metastases of haematopoietic antigen genomic concers and cancer metastases of haematopoietic antigen genomic concers and cancer metastases of haematopoietic antigen genomic concers and cancer metastases of haematopoietic antigen genomic concers and concers and conc
                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                               Chlamydia polypeptide SEQ ID NO 31.
                                                                                                                                                                                                                                                                      03-OCT-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a vaccine (I) for the immunisation of an animal against Chlamydia psittaci comprising at least one polynucleotide (Ia) having a C. psittaci sequence, or at least one C. psittaci antigen (Ib), and a carrier. (Ia) and (Ib) have antibacterial activity. (I) is useful for the immunisation of a bovine. The present sequence represents a C. psittaci antigen from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Chlamydia psittaci; vaccination; vaccine; antigen; immune response; immunisation; antibacterial; infection.
